LAB	PRACTICALS
20	**Implementation of SET Operators in SQL**

Create the following tables and perform the following queries:

Part – A

1. Display the name of students who is either in Computer or in Electrical.
```sql
SELECT Name FROM Computer
UNION
SELECT Name FROM Electrical;
```

2. Display the name of students who is either in Computer or in Electrical including duplicate data.
```sql
SELECT Name FROM Computer
UNION ALL
SELECT Name FROM Electrical;
```

3. Display name of students who is in both Computer and Electrical.
```sql
SELECT Name FROM Computer
INTERSECT
SELECT Name FROM Electrical;
```

4. Display name of students who are in Computer but not in Electrical.
```sql
SELECT Name FROM Computer
EXCEPT
SELECT Name FROM Electrical;
```

5. Display name of students who are in Electrical but not in Computer.
```sql
SELECT Name FROM Electrical
EXCEPT
SELECT Name FROM Computer;
```

6. Display all the details of students who are either in Computer or in Electrical.
```sql
SELECT * FROM Computer
UNION
SELECT * FROM Electrical;
```

7. Display all the details of students who are in both Computer and Electrical.
```sql
SELECT * FROM Computer
INTERSECT
SELECT * FROM Electrical;
```

Create the following table and perform the following queries:

Part – B

1. Find all unique employees present in either Employees_A OR Employees_B.
```sql
SELECT * FROM Employee_A
UNION
SELECT * FROM Employee_B;
```

2. Find ALL employees from both tables, including duplicates.

```
SELECT * FROM Employee_A
UNION ALL
SELECT * FROM Employee_B;
```

3. Find employees who are present in BOTH Employees_A AND Employees_B.

```
SELECT * FROM Employee_A
INTERSECT
SELECT * FROM Employee_B;
```

4. Find employees present in Employees_A BUT NOT in Employees_B.

```
SELECT * FROM Employee_A
EXCEPT
SELECT * FROM Employee_B;
```

5. Find employees present in Employees_B BUT NOT in Employees_A.

```
SELECT * FROM Employee_B
EXCEPT
SELECT * FROM Employee_A;
```

Part – C

6. Find unique employees belonging to the 'IT' department in either table.

```
SELECT * FROM Employee_A
WHERE Department = 'IT'
UNION
SELECT * FROM Employee_B
WHERE Department = 'IT';
```

7. Find employees who are in 'Sales' AND appear in both tables.

```
SELECT * FROM Employee_A
WHERE Department = 'Sales'
INTERSECT
SELECT * FROM Employee_B
WHERE Department = 'Sales';
```

8. List all names from both tables, retaining all duplicates.

```
SELECT EName FROM Employee_A
UNION ALL
SELECT EName FROM Employee_B;
```

9. Find employees in A with EmployeeID > 102, who are NOT in B.

```
SELECT * FROM Employee_A
WHERE EmpID > 102
EXCEPT
SELECT * FROM Employee_B;
```
